

## Mistake 1: Accidental Duplicate Closing Bracket (>> or ">")

- **Description:** Typing an extra closing angle bracket (>) when closing an HTML tag (for example, typing <p>> or <a href="...">></a>).
  - **Why it Happened:** Typographical errors during manual coding often leave stray brackets behind, which the web browser then prints directly onto the page as visible text.
  - **How to Fix:** Inspect the source code surrounding the visible extra symbol and delete the stray > character.
- 

## Mistake 2: Navigation Links Placed Without Proper Spacing or Line Breaks

- **Description:** Placing navigation links directly inside the header without using line break tags (<br>) or wrapping block elements.
  - **Why it Happened:** Anchor links (<a>) are inline elements, meaning they render side-by-side on a single line right next to headers or adjacent text unless explicitly forced onto a new line.
  - **How to Fix:** Insert <br> tags before and after the <nav> element or wrap the navigation section in a block-level container to force a clean vertical separation.
- 

## Mistake 3: Duplicate Paragraph Content in Category Descriptions

- **Description:** Copying the description text from "Laptops & Desktops" and pasting it directly under "Computer Peripherals" without updating the text.
  - **Why it Happened:** Reusing repetitive HTML markup structures often leads to forgotten placeholder text during manual content entry.
  - **How to Fix:** Write distinct, accurate descriptive text for each specific product category (such as highlighting keyboards, mice, and monitors under Peripherals).
- 

## Mistake 4: Using Invalid Comment Syntax (//)

- **Description:** Inserting section notes using double slashes (// Header Section) directly inside the HTML file.
- **Why it Happened:** Double slashes are used for comments in programming languages like JavaScript and C++, but in standard HTML, the browser treats // as plain visible text and displays it on the web page.
- **How to Fix:** Replace // with standard HTML comment syntax (<!-- Comment Text -->) or remove developer notes entirely prior to testing.
